Standard video playback software will access video data stored on such optical disks using a serial access format of accessing an optical disk in a linear order. Typically, the playback software will provide a rapid "pull down" of a current location in the optical disk, and then sequentially read the data from the optical disk. To be able to effectively transfer data to a player, the data must be compressed as described in the International Telegraph and Telephone Consultative Committee (ITU-T) H.261 recommendation (1990). One compression algorithm in the recommendation includes discrete cosine transform (DCT) coding. At a customer site, the player will have a video display unit and a storage device. To optimize system performance, the video data should be transferred from the optical disk to the storage device as efficiently as possible. It is known in the prior art that the video data is encoded and decoded using differential pulse code modulation (DPCM). For example, as described in the International Telecommunications Union (ITU-T) standard H.261, video data can be compressed with DPCM and Huffman decoding. As the digital video data from the optical disk is processed by the video player, a "home" is defined. The video data is played back from the beginning of the home, and the differential data between the current "home" position and the previous "home" position is processed. The differential data is encoded using DPCM, which provides the smallest amount of data in order to represent the data with an acceptable quality. As described in the ITU-T recommendation H.261, an image is divided into blocks of 8.times.8 pixels. Each block is further divided into 16 pixels, each being processed independently. It is known in the prior art that 16 pixels are accessed within an 8.times.8 block. The 16 pixels are accessed in a zig-zag order as shown in FIG. 1. In order to keep the hardware simple, only 8 of the 16 pixels (shown in black in FIG. 1) can be processed at any given time. To increase compression efficiency, the current "home" 2d92ce491b
