In this chapter, I cover a range of useful Photoshop tools that make your life as a graphic designer easier. I also cover some features that are helpful when dealing with text and web graphics. Life in Photoshop So you've come to the end of a long, arduous journey of endless tutorials on how to use Photoshop, and you're wondering what to do now. As a graphic designer, you're used to the whole project workflow — you start a project, take a lot of pictures, then finalize and export the images. The problem is that to complete that workflow, you have to use many different tools. To fix that workflow, Photoshop has a number of tools and features you can use, described in the following list. Workflow To edit and design images using Photoshop, you need to organize your images in a file structure that makes them easily organized. So, you need to decide how to store your images in a file system and export them with information. You also need to know how to save the exported version for delivery as well as how to save the files properly in a network folder. (See Chapter 2 for more information on how to save and export images.) Photoshop provides an overall layer-based editing system that helps you perform many functions faster than using the Photoshop features individually. Working on different layers with individual settings help you build a design quickly. You can add layers and edit them individually. However, a typical designer must know how to work with groups of layers, such as shapes, text, and colors, and be able to manage them in an easy way. The right tools help you work faster and more efficiently. Photoshop has a range of useful tools, including the type of tools you find on this list. Text tools Most designers use Photoshop to create and edit text and text-based graphics. You can use most of the type tools in Photoshop to place and edit text. After you create the text, you can add more artistic effects — for example, shadow effects or bleed effects. A Photoshop work station is a set of tools that assist with the most common tasks a graphic designer performs. The Tools panel has a range of tools that make tasks such as cutting, cropping, or resizing images faster and easier. The Tools panel is where you get access to the most commonly used tools. Photoshop tools are usually divided into two groups: Toolbar Layers The Toolbar

Brushes come with a variety of pre-defined looks. Some come with many different materials, such as Sable (for making artistic strokes), Chalk (for lines), and Blob (for making rough shapes). And you can add your own custom brushes with Photoshop's Brush Strokes feature. You can use brushes to modify existing images with Image → Adjustments → Blur → Gaussian Blur. This feature can be helpful in many different types of post-processing tasks. Brushes are the most essential tool for retouching and erasing image imperfections. With many tools in Photoshop, often a single pixel can be changed. However, with the Brush you have the ability to select a large block of pixels and edit them all at once. Brushes come with a variety of features, including options for softening, dodging, burning, and more. You can adjust the brush size, the amount of softening or dodging applied, or choose between detail, edge or no edge for the edge of the affected area. Multiple Features Brushes aren't just used for fixing or sculpting images. You can also use them to create a variety of effects. Brush Strokes A large collection of Brush Stroke presets. Q: Why are the radii of a collapsing star different from those of a non-collapsing star? I know how how the radius of a star is calculated. However, I don't understand why are there changes that happen when a star collapses. For example, let's say I have a star that is rotating and not collapsing. Everytime, I make an observation of the star, the radius of the star increases (by accretion?) I understand the reason why the "radius" of the star increases. But I don't understand why the radius is different when a star is collapsing in the first place? Why don't stars just collapse? What's the difference? A: A star that is rotating doesn't necessarily implode. It has to go through many processes before it does collapse. It does accrete mass and experiences a redshift of matter from inside it because of the centrifugal force, but it doesn't actually collapse. If you would have a star that was rotating but was collapsing, you would have quite a lot of pressure inside it which would tear the star apart. Not enough pressure to actually collapse it, but it is enough pressure that the star can't support its own weight anymore. If you want to know more, I highly suggest reading the wikipedia article on stellar evolution. ISR (intrusive strain release) is a type of polyurethane foam having abrasive or ablative properties. ISR is the designation which is used in the automotive industry for a class of polyurethane products which include polymers known as sprayed-in-place polyurethane, cast-in-place polyurethane, and reactive or free-flowing polyurethane. ISR products typically have two parts—a body and an outer skin. The cured product for ISR is a flexible, self-supporting but somewhat tacky layer with a low-stick or "soft" texture. ISR has been widely used in the industry as a sound-deadening material for the interior of automobile engine compartments. ISR is also used as a surface layer for treads or other rubber flooring or

for hand tool grips. ISR is used in virtually any application requiring abrasion resistance and superior sound deadening characteristics. ISR has been considered one of the best alternatives for polyurethane materials because of its cost effectiveness and ease of application. ISR is not a perfect material
